This sequence encodes the NOV9 protein. The invention relates to the NOV1-NOV16 proteins, and their coding sequences. The proteins have Cytostatic convictions, and their coding sequences. The proteins have Cytostatic contrivities. The sequences may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate NOVX expression. They may be used to treat disorders associated with decreased expression. They may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient, sequence NOVX or proteins, by inserting the muclaic acid into a cell and culturing it to patients own production of protein. They are used to produce NOVX or proteins, by inserting the muclaic acid into a cell and culturing it to express the protein. The DNA may be used as DNA probes in assays to detect and quantitate the presence of similar DNAs in samples, and which carriers may need restorative therapy. The NOVX protein may also be used as antigens in the production of antibodies (Abs) against NOVX and in assays to identify modulators of NOVX expression and activity. The anti-NOVX Abs are used for detecting the presence of NOVX in samples. Disorders that may be prevented, diagnosed and/or treated activity. The anti-NOVX Abs are used for detecting the presence of NOVX in samples. Disorders that may be prevented, diagnosed and/or treated contracting the serime/threonine kinase. Il phosphorylation sites characteristic of serime/threonine kinase. Il phosphorylation altes characteristic of serime/threonine kinase. CC e.g. Peutz-Jeghers syndomen callular proliferation and contraception). NOV2-3, NOV6 and NOV8 are homologous to the epidermal growth factor (EGF) -1 ke super family and are involved in, e.g. regulation of cell cevelopment, apoptosis, cell adhesion, growth migration, cell structure and motility and protein management, and are used to treat canders. Inflammatory disorders, immune disorders, inflammatory disorders, immune disease e.g. hypertrophic cardiovasc Novel human polypeptides and the nucleic acids that encode them useful for preventing, diagnosing and treating e.g. cancer, inflammation and

```
New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, crohn's disease, atherosclerosis, cancer, Huntington's disease or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of several novel human proteins, designated NOVX. These can be used in the treatment of diseases such as cancers, Hodgkin's disease, Von Hippellindau syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epliepsy, Lesch-Whan syndrome, multiple sclerosis, ataxia telangiectasia, leukodystrophies, addiction, anxiety, depression, pain, obesity, Crohn's disease, osteoporosis, inflammatory bowel disease, infertility, atherosclerosis, hypertension, scleroderma, haemophilia, diabetes, pancreatitis, autoimmune disease, asthma, arthritis, immunodeficiencies, HIV, viral, bacterial or parasitic infections, or graft-versus-host disease. The present sequence is a coding sequence of
                                                                                                                                                                                                                                                  Human, NOVX, single nucleotide polymorphism, SNP, anti-HIV, cytostatic; antiarteriosclerotic; antidiabetic; antiasthmatic; antiinflammatory; haemostatic; hypotensive; neuroprotective; anorectic; nootropic; antidepressant; immunosuppressive; antibacterial; antiparsitic; virucide; tranquilizer; anticonvulsant; osteopathic; analgesic; antiparkinsonian; dermatological; antiinfertility; cerebroprotective;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Shimkets RA, Patturajan M, Vernet CAM, Casman SJ, Malyankar U, Shenoy S, Syptek KA, Gangolli E, Miller C, Boldog F, Li Li, Taupier RJ, Kekuda R, Santibson G, Zerhusen BD, Liu X, Colman SD; Tchernev V, Si J, Edinger S, Stone D, Sciore P, Millet I;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, Crohn's disease, atherosclerosis, cancer, Huntington's disease
                                                                                                                                                                                                                                           Human; NOVX; single nucleotide polymorphism; SNP; anti-HIV; cytostatic; antiarteriosclerotic; antidiabetic; antiasthmatic; antiinflammatory; hypotensive; neuroprotective; anorectic; nootropic; antidepressant; immunosuppressaive; antibacterial; antiparasitic; virucide; tranquilizer; anticonvulsant; osteopathic; analgesic; antiparkinsonian; dermatological; antinfertility; cerebroprotective;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of several novel human proteins, designated NOVX. These can be used in the treatment of diseases such as cancers, Hodgkin's disease, Von Hippel-Lindau syndrome, Alzheimer's disease, stroke, tuberous sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ian M, Vernet CAM, Casman SJ, Malyankar U;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a method of targeting a compound to a cell or tissue of an individual expressing a functionally active hyaluronan (HA) receptor for endocytosis (HARE) or a cell that does not express functionally active HARE. The method involves using HA molecule, a chondroitin molecule (CD), a chondroitin sulphate (CDS) molecule, and/or a monoclonal antibody raised against a HA-binding domain of HARE. The method is useful for targeting a compound, preferably a chemcherapeutic agent or a radioisotope to cell of an individual, especially a human, expressing HARE on its surface (e.g. gene therapy). Also described is a method useful for preventing interaction between a cell having at least
                                                                                                                                                                                                                                                                                                                                                                                  Hyaluronan receptor for endocytosis; HARE; hyaluronan; HA; CD; chondroitin molecule; chondroitin sulphate; CDS; targeting; metastasis; tumour; gene therapy; rat; gene; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      one of a HA coat, a CD coat and CDS coat and a cell expressing HARE on presenting accertaints second method is useful for preventing metatlesis by preventing interaction between tumour cells having HA, CD or CDS coat and non-tumour cells expressing HARE on its surface. The invention also a biological fund for detecting the presence of HA, CD and CDS in receptor for endocytosis (HARE)

             anticonvulent; antiathritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; dermatological; immunosuppressive; antithromatic; antithromatic; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiavascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary;

```
This sequence encodes the NOV2 protein. The invention relates to the NOV1-NOV16 proteins, and their coding sequences. The proteins have Cytostatic contraceptive; antiinflammatory; immunomodulatory; and cardiovascular activities. The sequences may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate NOVX expression. They may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of protein by expressing inactive proteins or to supplement the patients own production of protein. They are used to produce NOVX

proteins, by inserting the nucleic acid into a cell and culturing it to detect and quantizate the presence of similar DNAs in samples, and which patients may need restorative therapy. The NOVX protein may also be used as antigens in the production of antibodies (Abs) against NOVX and in aspatient for an antigens in the production of antibodies (Abs) against NOVX and in aspats to identify modulators of NOVX expression and activity. The anti-NOVX Abs are used for down regulate expression and activity. The anti-NOVX Abs are used for detecting the presence of NOVX in samples. Disorders that may be prevented, diagnosed and/or treaded vary depending on the NOVX protein. NOVI, NOVI, NOVI, NOVI, 100 NOVI and NOVI and are used for teat kinase-related disorders (e.g. Peutz-Jeghers syndrome, cellular proliferation and contraception) NOV2-1 NOVS and NOVS are homologous to the epidermal growth factor (BGF) cles meaning the protein management, and are used to treat cancers, and motility and protein management, and are used to treat cancers, immune disorders and cellular adhesion disorders of inflammatory disorders, immune disorders and cellular adhesion disorders and motility and stellular proliferations and are used to treat cancers, inflammatory disorders, immune disorders and cellular adhesion disorders and cardiovascular disease e.g. hypertrophic cardiowapopathy, long-OT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1728

The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease,

The present sequence encodes a human lymphatic endothelial glycoprotein, designated as common lymphatic endothelial and vascular endothelial receptor a scommon lymphatic endothelial and vascular endothelial receptor 1 (CLEVER-1). Which has a molecular weight of 270-300 kD in sodiuw dodecyl sulphate-polyacrylande gel electrophoresis (SDS-PAGE) cunder non-reducing conditions, recognisable by a monoclonal antibody constraint the group consisting of DSM ACC 2519 or 2590. Also described: (1) a CLEVER-1 antibody; (2) a cell-free preparation comprising CLEVER-1; (3) diagnosing inflammatory diseases in a patient; (4) detecting malignant cells in a patient; (5) identifying an agent that stimulates or inhibits the binding of CLEVER-1 to cells; (6) removing malignant cells from a sample; (7) treating inflammation in a patient; (8) preventing metastasis in a patient; and (9) stimulating CLEVER-1; (8) preventing metastasis in a patient; and (9) stimulating CLEVER-1; contidiated; antirheumatic, antiarthritic, osteopathic, antiasthmatic, antidiabetic, antiartheumatic, not cupacity, instrumentory contropic and contropic and the present invention can be used for treating inflammation; diabetes, or chronic inflammatory diseases so from a setting inflammation; diabetes, or chronic inflammatory diseases sond as skin inflammation; diabetes, osteoarthritis), obstructive and restrictive lung diseases (such as ulcerathritis), ties and Crohn's diseases, varial diseases (such as theroselize path and path of path of path of path of path of path of path of path of path of path of path of path of path of path of path of path of path of path of p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          6487 ACCGGCCTGAACACACGCGCTGTGAGTGCCACGCAGGCTACGTAGGCGATGGACTGCAG 6546

                                                                                                                                                                                                                                                                          New hyaluron-binding proteins, known as full-length WF-HABP, WF-HABP, HABP and BM-HABP, useful for treating proliferative conditions, metastasis, inflammation, ischemia, arthritis and multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes a hyaluronan-binding protein. The specification describes four hyaluronan-binding protein, known as WF-HABP, WF-HABP, OB-HABP. The polypeptides are useful for treating diseases such as proliferative conditions, metastasis, inflammation, ischemia, host defence dysfunction, immune surveillance dysfunction, arthritis, multiple sclerosis, autoimmunity, immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cys --- GluProGluGlnLeuProIleAspArgCysLeuGlnAspAsnGlyGlnCysHis
